

# THE POWER OF REMENDER™

Remend's goal is to commoditize the audit defense market by empowering customers to replicate an Oracle audit for themselves.

**REMENDER IS A CLOUD-BASED PLATFORM** that consumes Oracle license audit files and analyzes them just like Oracle LMS does.

**REMENDER TURNS MONTHS INTO MINUTES** by quickly analyzing Oracle software installation and usage data no matter the size or complexity of your environment.

**REMENDER IS FEATURE-RICH** and offers ad-hoc reporting, Excel-based summaries and clear, concise GUI interaction.

**REMENDER IS CONFIDENTIAL** offering INCOGNITO mode in which no recognizable data is stored in the cloud.

**REMENDER ELIMINATES DRIFT** by tracking, identifying and resolving license issues as they occur.

**REMENDER ENABLES USERS** to analyze opportunities for optimization and cloud-readiness.

Armed with Remender, you can mitigate risk, budget for agreeable, value-based license deficits, integrate future-state plans and create a negotiation strategy, all within days of receiving the Oracle audit notice.

## PREPARE AND DEFEND YOURSELF DURING AN ORACLE AUDIT

License audits have been an effective, revenue-driving business practice of Oracle for decades. Oracle software is readily available online, does not require license keys to use at any volume, and installs premium features automatically.

Running Oracle software contractually obligates you to participate in license audits. These audits are inevitable, and if you're not proactively measuring and managing your license position, you're at Oracle's mercy. In addition, you're in a time-crunch! You have 45 days from receiving an audit notice to respond, and then 30 days from an audit report to pay for any license shortfalls.

In 2019, Oracle updated its standard license terms to require customers run and provide the output of its measurement tools to Oracle. Those measurement tools include LMS Collection Tool, ReviewLite, WebLogic Basic Check, CPU Query and others. These tools are intrusive, require root access, gather Megabytes (often Gigabytes) of confidential data, and are effectively impossible to decipher.

There are helpful asset management tools out there, including providers that participate in Oracle's third-party program, but they are expensive and difficult to implement effectively. Furthermore, the market is rife with independent consultants, boutique firms, systems integrators and resellers, making it difficult to decide who to trust.

At Remend, **our goal is to commoditize the audit defense and tools market by empowering customers to replicate an Oracle audit for themselves.** With our market-leading Remender, you can know—not wonder—what Oracle will make of your compliance position. Visit us at [www.remend.com](http://www.remend.com) to get started with your free instance of Remender today!
